

Level 2

Challenge A

Directions:

In the `Haskell_Challenges.hs` file, create a function called `"addLastNItems"` that does the following:

The function will take in a list of ints and an int, `n`. It should return the sum of the last `n` items in the given list. There are edge cases you must adhere to:

- If `n` is 0, return 0
- If `n` is negative, return -1
- If `n` is greater than the size of the list, return the sum of all items in the list plus 1
- If an empty list is given, ignore `n` and return -2

You will need to figure out an appropriate data type for this function.

Examples:

```
{- call -} addLastNItems [1,2,3,4,5] 1  
{- returns -} 5
```

```
{- call -} addLastNItems [1,2,3,4,5] 2  
{- returns -} 9
```

```
{- call -} addLastNItems [1,2,3,4,5] 3  
{- returns -} 12
```

```
{- call -} addLastNItems [1,2,3,4,5] 5  
{- returns -} 15
```

```
{- call -} addLastNItems [1,2,3,4,5] 20  
{- returns -} 16
```

```
{- call -} addLastNItems [1,2,3,4,5] (-5)  
{- returns -} -1
```

```
{- call -} addLastNItems [1,2,3,4,5] 0  
{- returns -} 0
```

```
{- call -} addLastNItems [] 0  
{- returns -} -2
```
