

Level 2

Challenge C

Directions:

In the `Haskell_Challenges.hs` file, create a function called `"breakdownChars"` that does the following:

The function will take in a `String`. It will go through each character in the string and grab its ASCII value. It will then convert the character and ASCII value to separate strings and put them into a list. It will do this for each character in the given string parameter, creating a bigger list from these small lists. This will result in the function returning a list of `String` lists.

You will need to use the `ord` function for this challenge, which is already imported into your file on line 2 (i.e. `import Data.Char (ord)`)

I would recommend manually using recursion for this challenge. Also, converting a char into a string should not be done using the `"show"` function. There is a different, but very easy way to convert that doesn't result in single quotes being in the string.

You will need to figure out an appropriate data type for this function.

Examples:

```
{- call -} breakdownChars "abc"
{- returns -}  [["a","97"],["b","98"],["c","99"]]
```

```
{- call -} breakdownChars "012"
{- returns -}  [["0","48"],["1","49"],["2","50"]]
```

```
{- call -} breakdownChars "Hello World"
{- returns -}  [["H","72"],["e","101"],["l","108"],["l","108"],
["o","111"],[" ","32"],["W","87"],["o","111"],["r","114"],["l","108"],
["d","100"]]
```

```
{- call -} breakdownChars " "
{- returns -}  [[" ","32"]]
```

```
{- call -} breakdownChars ""
{- returns -}  []
```
