

## Level 1

### Challenge B

---

#### Directions:

In the `Haskell_Challenges.hs` file, create a function called `"powList"` that does the following:

The function will take in an int exponent and a list of ints. It will return the values in the list raised to that exponent.

You will have to figure out an appropriate data type for this function and then define it in the challenges file.

#### Examples:

```
{- call -} powList 1 [1, 2, 3, 4, 5]
{- returns -} [1,2,3,4,5]

{- call -} powList 2 [1, 2, 3, 4, 5]
{- returns -} [1,4,9,16,25]

{- call -} powList 3 [-1, 2, -3, 4, -5]
{- returns -} [-1,8,-27,64,-125]

{- call -} powList 4 [-5, 0, 9, 3, 11]
{- returns -} [625,0,6561,81,14641]
```
