

Level 1

Challenge A

Directions:

In the `prolog_challenges.hs` file, create a predicate called `"number_sign"` that does the following:

The predicate will take in a number. If that number is negative, it unifies its second parameter to `-1`. If that number is 0, it unifies with 0. If that number is positive, it unifies with `+1`.

Examples:

```
/* query */  ?- number_sign(-50, Sign).  
/* result */ Sign = -1.
```

```
/* query */  ?- number_sign(0, Sign).  
/* result */ Sign = 0.
```

```
/* query */  ?- number_sign(150, Sign).  
/* result */ Sign = 1.
```
