

## Level 2

### Challenge C

#### Directions:

In the `prolog_challenges.pl` file, create a predicate called `"list_evensum_oddsum"` that does the following:

The predicate will have the following parameters: `List` - a list of integers, `EvenSum` - sum of the even numbers, `OddSum` - sum of the odd numbers. Remember you can use `cut !` to eliminate alternatives. You should see a period after the `EvenSum` and `OddSum` is shown when running this predicate.

#### Examples:

```
/* query */  ?- list_evensum_oddsum([1,2,3], EvenSum, OddSum) .
/* result */ EvenSum = 2,
              OddSum = 4.

/* query */  ?- list_evensum_oddsum([8,4,27,0,19], EvenSum, OddSum) .
/* result */ EvenSum = 12,
              OddSum = 46.

/* query */  ?- list_evensum_oddsum([6,4,4], EvenSum, OddSum) .
/* result */ EvenSum = 14,
              OddSum = 0.

/* query */  ?- list_evensum_oddsum([], EvenSum, OddSum) .
/* result */ EvenSum = OddSum, OddSum = 0.

/* query */  ?- list_evensum_oddsum([1,2,3,4,5], 6, 9) .
/* result */ true.
```
